

Daniel S. Weile obtained his B.S.E.E and his B.S. (in Mathematics) at the University of Maryland at College Park and 1994, and M.S. and Ph.D. in Electrical Engineering at the University of Illinois at Urbana-Champaign in 1995 and 1999, respectively. Currently, he is an Associate Professor of Electrical Engineering at the University of Delaware. In 1994, he worked at the Institute for Plasma Research developing interactive software for the design of depressed collectors for gyrotron beams. As a research assistant and Visiting Assistant Professor at the University of Illinois, Dr. Weile worked on the efficient design of electromagnetic devices using stochastic optimization techniques, and fast time-domain integral equation methods for the solution of scattering problems. His current research interests include computational electromagnetics (especially time-domain integral equations), relativity and continuum mechanics, and the use of evolutionary optimization in electromagnetic design. Dr. Weile is a recipient of an NSF CAREER award and an ONR Young Investigator Award, and is currently an Associate Editor for *IEEE Antennas and Propagation Magazine*.
